2. Terms and definitions

6A Heavy Oils
‘Generalized Crude Oils’, Correction of Volume to 60 °F against API Gravity.

6B Light Oils
‘Generalized Products’, Correction of Volume to 60 °F against API Gravity.

6C Chemical
‘Volume Correction Factors (VCF)’ for individual and special applications, volume correction to 60 °F against thermal expansion coefficients.

6C Mod
An adjustable temperature reference for defining VCF.

A

API gravity
The measure of how heavy or light a petroleum liquid is compared to water. Allowable values are 0 to 100 degrees API for (6A) and 0 to 85 degrees API for (6B).

D

DDA (Direct Digital Access)
The proprietary digital protocol developed by MTS for use in intrinsically safe areas.

Density
Mass divided by the volume of an object at a specific temperature. The density value should be entered as lb / cu. ft.

E

Explosion proof
Type of protection based on enclosure in which the parts which can ignite an explosive gas atmosphere are placed within, and which can withstand the pressure developed during an internal explosion of an explosive mixture, and which prevents the transmission of the explosion to the explosive gas atmosphere surrounding the enclosure.

F

Flameproof
Type of protection based on enclosure in which the parts which can ignite an explosive gas atmosphere are placed within and which can withstand the pressure developed during an internal explosion of an explosive mixture, and which prevents the transmission of the explosion to the explosive gas atmosphere surrounding the enclosure.

G

GOVI (Gross Observed Volume of the Interface)
The total volume of the tank occupied by the interface liquid. The GOVI is only given when measuring two liquids and is calculated by subtracting the volume of the product from the total volume of liquid in the tank (GOVT – GOVP).

GOVP (Gross Observed Volume of the Product)
The total volume of the tank occupied by the product liquid. When measuring only one liquid, it is also the total volume of liquid in the tank (GOVT). When measuring two liquids it is the total volume of liquid in the tank minus the volume of the interface liquid (GOVT – GOVI).

GOVT (Total Gross Observed Volume)
The total volume of liquid in the tank. When measuring only one liquid it is equal to the volume of the product (GOVP). When measuring two liquids it is equal to the volume of the product and interface liquids (GOVP + GOVI).

GOVU (Gross Observed Volume Ullage)
The difference in volume between the working capacity of a tank and the total volume in the tank (Working Capacity – GOVT).

H

HART®
A Bidirectional communication protocol that provides data access between intelligent field instruments and host systems.

I

Interface
Noun; The measurement of the level of one liquid when that liquid is below another liquid.

Interface
Adj.; The Software Graphical User Interface (GUI) that allows the user to access software protocols (HART®, DDA, MODBUS).

Intrinsic safety
‘Intrinsically safe’ - Type of protection based on the restriction of electrical energy within apparatus of interconnecting wiring exposed to potentially explosive atmosphere to a level below that which can cause ignition by either sparking or heating effects.

L

LRV - Lower Range Value
Parameter in HART® for controlling where the 4 mA set point.

<td></td>
</tr>
</tbody>
</table>

**Sphere Radius**

The internal radius of the sphere that contains the liquid, the value is used to calculate the volume along with the Sphere Offset.

**Sphere Offset**

An offset value that accounts for additional volume in a sphere from non-uniform sphere geometry, the value is used to calculate the volume along with the Sphere Radius.

**Strap Table**

A table of measurement correlating the height of a vessel to the volume that is contained at that height. The transmitter can contain up to 100 points.

**SV - Secondary Variable**

Second variable in HART® that is communicated. SV is set to Loop 2 (Interface Level) by default unless temperature is ordered and the temperature is default.

**TEC**

‘Thermal Expansion Coefficient’ - a value correlating the change in temperature for an object with the change in its volume. Allowable values are 270.0 to 930.0. TEC units are in 10 E-6/Deg F.

**Temperature Correction Method**

One of five product correction methods used to correct the product volume in the tank due to changes in temperature from 60 °F including \(6A, 6B, 6C, 6C \text{ Mod}, \text{ and } \text{Custom Table}.\)

**TV - Tertiary Variable**

Third variable in HART® that is communicated. TV is set to temperature by default.

**URV - Upper Range Value**

Parameter in HART® for controlling where the 20 mA set point.

**Volume Calculation Mode**

One of two methods use to calculate volume measurements from level measurements, including Sphere and Strap Table.

**VCF (Volume Correction Factor)**

A table of measurements correlating temperature points with correction factors for the liquids expansion/contraction. The transmitter can contain up to 50 points.

**Working Capacity**

The maximum volume of liquid that the user desires for their vessel to hold, typically 80 % of the vessels maximum volume before overfill.
3. Introduction

3.1 Purpose and use of this manual

Important:
Before starting the operation of the equipment read this documentation thoroughly and follow the safety information.

The content of this technical documentation and of its various annexes is intended to provide information on the HART® Interface of the LP Series. All safety related information is in the product specific operation manual.

3.2 Used symbols and warnings

Warnings are intended for your personal safety and for avoidance of damage to the described product or connected devices. In this documentation, safety information and warnings to avoid dangers that might affect the life and health of personnel or cause material damage are highlighted by the preceding pictogram, which is defined below.

<table>
<thead>
<tr>

4. Safety instructions

4.1 Intended use

The purpose of this document is to provide detailed information on the protocol interface. All safety related information is in the product specific operation manual. Consult the operation manual before connecting to the level transmitter.

5. Product overview

5.1 Before you begin

NOTICE
Output will vary depending on the location of the 4 and 20 mA set points.

Tools needed:
- 24 Vdc linear regulated power supply
- Current meter

5.2 Quick start-up procedure

1. Connect 24 Vdc power supply to Loop 1.
2. Turn on power supply.
3. Connect Current Meter to test pins on interconnect board. Loop 1 Test Pins are on the bottom left and labeled TP1 and TP2.
4. Move the float towards the tip of the pipe and verify 4 mA set point.
5. Move the float towards the top of the pipe and verify 20 mA set point.
6. If using two floats, repeat steps 4 and 5 for second float. Test pins for Loop 2 are TP5 and TP6. Note both floats must be present or else the level transmitter will go into alarm.
7. Turn off power and disconnect power supply and current meter.
8. Install in tank.

6. Display Menu

All LP-Series liquid level transmitters are shipped with a Stylus (MTS Part # 404108) to be used for manipulating the display. For single and dual cavity housings, the Stylus is designed to allow for programming of the unit without removing the housing. For NEMA housings the housing must be removed to access the display. Place your finger between the display and stylus for correct spacing. When using the Stylus make sure to align the Stylus with the shape outline around the buttons in the same orientation. Failure to correctly align the Stylus can cause the display to not function properly.

NOTICE
Do not use any device other than the MTS Stylus to operate the display on the LP Series.

NOTICE
Improper use of the Stylus can cause the display to not function properly.

Fig. 1: Stylus (MTS Part # 404108)
6.1 Operation Modes

The LP Series level transmitter runs in one of the following modes of operation. You can use these modes to calibrate and set up various operating parameters.

6.1.1 Run Mode

Run mode is the primary mode of operation. This mode will perform measurements, display data, and respond to HART® commands.

6.1.2 Program Mode

Program mode is the primary mode for commissioning and troubleshooting the level transmitter. The full menu and available functions are shown in section 6.3 Menu Structure. To enter program mode use the Stylus and press the Enter Key as shown in section 6.2 Display Diagram. Program Mode is protected by a password to keep unwarranted changes from occurring.

**NOTICE**

Whenever program mode is exited from the display the unit will reset itself to insure all changes have been accepted. The reset will take approximately 5 seconds before the level transmitter is able to respond to commands.

When in program mode, remote communications are not functional. An automatic timeout feature is provided so that the transmitter does not remain inadvertently in program mode. The timeout is set for 1 minute before prompted for additional time. Total timeout is 2 minutes.

**NOTICE**

The factory default password is 27513.

In program mode, the transmitter will not respond to incoming HART® commands. A busy error will be sent to the controller to notify the unit is in program mode. This function will prevent a user at a remote terminal from programming the unit while a user is accessing program mode from the display.

7. Alarms

MTS has two separate types of alarms featuring both a software fault alarm and a hardware fault alarm.

7.1 Software Fault Alarm

MTS offers a software fault alarm that will force the 4…20 mA output into an either a low or high alarm state. The default setting from the factory is a low alarm state. The low alarm state is ≤ 3.6 mA and the high alarm state is ≥ 21 mA. The software fault alarm follows the recommendations set forth by NAMUR NE 43. Typical faults that will cause a software fault alarm are a missing float, the float in the inactive range, and the level transmitter looking for the wrong number of floats.

7.2 Hardware Fault Alarm

MTS offers a hardware fault alarm that will force the 4…20 mA output into a low alarm. The hardware low alarm is 3.2 mA. The hardware low alarm is triggered when the internal diagnostics of the level transmitter have detected a hardware issue with the 4…20 mA output.
## 8. Alarms

</table>
9. HART® Interface

MTS Sensors has tested and is compliant to HART® ITK 7.2. The device driver file is available for download from HART® Communication Protocol website at: www.fieldcommgroup.org. Programming via HART® can be done either using the LP Dashboard via a HART® modem a handheld programmer with the LP-Series driver.

9.1 LP Dashboard

9.1.1 Installing LP Dashboard

Adjustments to the setup and calibration of the HART® Interface can be performed using the MTS LP Dashboard. The Dashboard can be run from any Windows 7 or newer OS using a HART® to USB converter (MTS part #380068).

Perform the following steps to install the LP Dashboard and establish communication:

1. Install LP Dashboard from the USB stick that came with the level transmitter or go to www.mtssensors.com to download the latest version.
2. Connect level transmitter to HART® to USB converter, connect 24 Vdc power to the level transmitter, and connect the HART® to USB converter to the PC. Example setup shown below.
3. Open setup software and select HART® protocol from drop down menu.
4. Select COM Port. Software will show active COM ports. Make sure converter is connected before starting LP Dashboard or COM port will not show.

**NOTICE**
Power must be on Loop 1 for HART® communication to work. Power does not have to be applied on Loop 2 for HART® to work. Power must be applied to Loop 2 to check current output.

**NOTICE**
HART® requires a load resistor to work correctly. Add a 250 Ohm resistor for proper communication. Some PLC cards will have built in load resistors.

The LP Dashboard Home Screen will look different based on whether or not temperature has been ordered. If the level transmitter includes temperature measurement then the Home Screen will look as shown. If the level transmitter does not include temperature measurement then the Home Screen will not show the middle panel for temperature. The Home Screen can be accessed by pressing the three white bars on the top left.
The level panel on top shows the level measurement for the Product level and Interface level. If only the product float is selected then only the product float will be shown. The bold numbers are the numerical level and the graph is a time lapse of the graphical representation of the numbers. The red line is the approximate maximum level based off of the order length of the level transmitter. The numbers on the right of the level panel are the Trigger Level for the Product Float on top and the Interface Float on bottom. These are a representation of how strong of a return signal the level transmitter is experiencing.

The temperature panel will only show if temperature measurement was ordered and turned on. The left side shows the numerical value of temperature. The bar graph in the middle of the panel shows temperature measurement point.

The bottom panel shows the percentage and current output of Loop 1 and if equipped Loop 2. Do note that there is a delay between the actual output in real-time and the information shown on the LP Dashboard.

Across the bottom of the Home Screen is the visual indication of the fault codes from section 8. Green indicates no fault and red indicates fault. Next is the firmware version in the middle followed by the serial number.

9.1.3 Configuration

Factory Set
Auto Threshold: Default setting is ON and should not be turned off. This feature allows the unit to automatically adjust the threshold for optimal performance.
Lobe Test: A functional test to make sure the return signal from MTS has the correct shape. Lobe Test should be on unless using a magnet not supplied by MTS.
Noise Detection: A functional test to determine if noise is entering the MTS level transmitter.
Product Float: Default setting of ON for all applications.
Interface Float: Default setting of ON if ordering 2 Loops. Default setting of OFF if ordering 1 Loop. If the number of floats turned on is different from the number of floats physically on the level transmitter the level transmitter will go into Fault.
Serial Number: Serial Number assigned by MTS at the time of manufacture. The serial number is used for tracking and replacement parts. HART® only displays 6 of 8 digits. Do not change.
Temperature: Default setting of OFF if ordered without temperature. Default setting of ON if ordered with temperature. Turning temperature ON when the level transmitter was not ordered with temperature will not cause temperature to work and will force the level transmitter into Fault.
Filtering: An internal filtering process for the temperature measurement. Filtering should be ON.
6” Delta: Internal setting. Leave OFF.
Display Enable: Default setting of ON. Display can be turned off by changing to OFF and cycling power.
LOOP2 Present: Internal flag to turn on Loop 2. Changing this will not allow a second loop unless the hardware was ordered with a second loop.

User Configurable
Reverse Measure: Allows the end user to change the direction in which the MTS level transmitter counts. The default setting is OFF and the level transmitter will reference the tip of the pipe/hose and count up from the tip. The ON setting will reference the head of the level transmitter and count up as it moves towards the tip.
Device Address: The end user can configure the HART® address if being used in a multidrop network. Default address is 0. Do not change from 0 unless all communication will be done via HART® as the current loop will not respond in multidrop mode.
Display Setting: Allows the end user to configure the display. Available options are level in engineering units, current (mA), or percentage full. Default setting is level.
Alarm Setting: Allows the end user to configure a High (>21 mA) or Low (<3.6 mA) alarm for level transmitter. Default setting is Low (<3.6 mA) alarm.

9.1.4 Signal settings

Factory Set
Gradient: Is the speed at which the magnetostrictive signals travel
along the sensing element. Typical range is from 8.9 to 9.2. Do not change unless replacing the sensing element. Changing this number will directly affect accuracy. **Signal Gain:** Is the strength of the interrogation pulse. MTS uses the same electronics for all lengths and adjusts the signal based on the order length. Do not change unless instructed to do so by the MTS Factory.

### 9.1.5 Level settings

**Factory Set**  
**Product Offset:** the full length of the level transmitter including order length, inactive zones, and mounting length. The offset will change after using the Enter Current Tank Level for the Product. The Product Offset and Interface Offset are independent of one another.  
**Interface Offset:** the full length of the level transmitter including order length, inactive zones, and mounting length. The offset will change after using the Enter Current Tank Level for the Interface. The Product Offset and Interface Offset are independent of one another.

**User Configurable**  
**Length Units:** the unit of measurement used for engineering units. Default is inches if ordered in inches and mm if ordered in mm. Options include inches, feet, millimeters, centimeters, and meters.  
**Method – Enter Current Tank Level:** a calibration method that calibrates the level transmitter based off of one point of measurement. Select Enter Current Tank Level from the Method drop down box. Go to Product Level and enter value of current product level based off of a manual measurement while the tank level is not changing. Go to Interface Level and enter value of current interface level based off of a manual measurement while the tank is not changing. Click the Write button at the top of the software. Click to confirm on the pop-up. Level transmitter is now calibrated.

### 9.1.6 Temperature settings

**Factory Set**  
**Position:** The location of the temperature sensor in reference to the end of the pipe.  
**Slope:** Calibration factor for the temperature sensor. Do not change unless a new sensing element with temperature is ordered.  
**Intercept:** Calibration factor for the temperature sensor. Do not change unless a new sensing element with temperature is ordered.

**User Configurable**  
**Temperature Units:** Change the units of measure for the temperature settings. Options are Fahrenheit or Celsius.  
**Number of Averages:** Change the number of temperature readings used in the rolling average.

### 9.1.7 Analog settings

**User Configurable**  
**Product Zero:** Change the Zero (LRV, 4mA) set point of the product level. The set point needs to be in the active range.  
**Product Span:** Change the Span (URV, 20mA) set point of the product level. The set point needs to be in the active range.
**Interface Zero**: Chang the Zero (LRV, 4mA) set point of the interface level. The set point needs to be in the active range.

**Interface Span**: Chang the Span (URV, 20mA) set point of the interface level. The set point needs to be in the active range.

**Temp Zero**: Chang the Zero (LRV, 4mA) set point of the temperature. The set point needs to be in the active range. The Temp Zero needs to be less than the Temp Span.

**Temp Span**: Chang the Span (URV, 20mA) set point of the temperature. The set point needs to be in the active range. The Temp Zero needs to be less than the Temp Span.

**Product Damping**: Slows the rate of change of the product level. Default setting is 0.4s.

**Interface Damping**: Slows the rate of change of the interface level. Default setting is 0.4s.

**Temp Damping**: Slows the rate of change of the temperature. Default setting is 0.4s.

**PV**: Select the process variable that is used as the PV in HART® and Loop 1 output. Product, Interface, or Temperature can be used.

**SV**: Select the process variable that is used as the SV in HART® and Loop 2 output. Product, Interface, or Temperature can be used. SV can be same as PV.

**TV**: Select the process variable that is used as the TV in HART®. Product, Interface, or Temperature can be used. TV can be the same as SV and/or PV.

### 9.1.8 Flash settings

**Flash Actions**

- Smart to Factory Defaults
- Fix fault code 128
- Cycle power the device

**Temperature**

**71.387**

### 9.1.9 Save settings

**User Configurable**

**Read Settings from File**: Allows the end user to upload factory parameters from a backup file to the LP Dashboard. This task is usually performed from a saved backup file or the original backup file maintained by MTS.

**Write Setting to a File**: Allows the end user to download a backup file of factory parameters from the LP Dashboard to a PC. This task is usually performed after Read Settings from Gauge.

**Write Settings to Gauge**: Allows the end user to program the level transmitter with the factory parameters displayed on the LP Dashboard. This task is usually performed after Read Settings from Gauge.

**Read Settings from Gauge**: Allows the end user to update all of the factory parameters displayed on the screen. All settings will turn red and then will turn white as they are updated.

**NOTICE**

A copy of the backup file is maintained by MTS including all factory parameters as the level transmitter was originally setup after completing testing and calibration at the MTS factory. MTS can provide a copy of the backup file upon request based off of the serial number of the level transmitter. Contact MTS Technical Support for assistance.

**User Configurable**

**Reset to Factory Defaults**: Allows the end user to reset all settings back to the original settings as they were when they left the MTS factory. This is intended to be used as a first step in troubleshooting. Do note, the Zero and Span set points will reset to factory settings.

**Fix fault code 128**: If fault code 128 appears red then click the link on the Dashboard to clear the fault.

**Cycle power the device**: Allows the end user to have the level transmitter automatically turn power off, turn power on, and reboot the device.
9.2 Handheld Programming

9.2.1 Handheld Menu Tree

NOTICE
The LP-Series driver must be loaded on the handheld HART® communicator in order to turn off Write Protect which is enabled by default. If the driver is not present contact the manufacturer of the handheld HART® communicator about updating the DD files on the handheld.

9.2.2 Handheld Menu Screenshots

9.2.2.1 Online Menu Screen

Fig. 13: Online Screen

Parameters
No Editable Parameters

Data
PV, PV Loop current, PV LVR, and PV URV are all shown on screen

9.2.2.2 Device setup Menu Screen

Fig. 14: Write Protect Enabled Screen

Parameters
Write Protect - user can turn disable or enable write protect mode. While write protect is enabled no variables can be changed and the full menu tree cannot be seen.

Data
No Data is displayed

9.2.2.3 Process variables Menu Screen

Fig. 15: Write Protect Disabled

Parameters
PV – Primary Variable is the HART® parameter that is by default mapped to the Product Level. This can be changed using Variable mapping feature. SIL2 Capable units do not allow the PV to be changed.

SV – Secondary Variable is the HART® parameter that is mapped to the Interface Level unless Temperature is ordered. This can be changed using the Variable mapping feature.

TV – Tertiary Variable is the HART® parameter that is mapped to the Temperature by default. This can be changed using the Variable mapping feature.

Data
No Data is displayed
9.2.2.4 PV Menu Tree

Parameters
- **Level 1 LRV** – lower range value of the PV that correlates to the location of the 4 mA set point of the output.
- **Level 1 URV** – upper range value of the PV that correlates to the location of the 20 mA set point of the output.

Data
- **Level 1** – the product level is displayed.
- **PV % range** – the percentage (0 to 100%) of the active range that the process variable is currently at.
- **PV Loop current** – the current output level of the PV based on the settings of the LRV, URV, and Level 1.

9.2.2.5 SV Menu Tree

Parameters
- **Level 2 LRV** – lower range value of the SV that correlates to the location of the 4 mA set point of the output.
- **Level 2 URV** – upper range value of the SV that correlates to the location of the 20 mA set point of the output.

Data
- **Level 2** – the interface level is displayed.
- **SV % range** – the percentage (0 to 100%) of the active range that the process variable is currently at.
- **SV Loop current** – the current output level of the SV based on the settings of the LRV, URV, and Level 2.

9.2.2.6 TV Menu Screen

Parameters
- **Temp LRV** – lower range value of the TV that correlates to the location of the 4 mA set point of the output.
- **Temp URV** – upper range value of the TV that correlates to the location of the 20 mA set point of the output.

Data
- **Temp** – the temperature is displayed.

9.2.2.7 Diag/Service Menu Screen

Parameters
- **Loop Test** - allows the user to set current loop to specific outputs to test functionality.
- **Set Factory Values** – clears all programming and resets factory parameters to default values. Do not perform this function unless instructed to do so by factory technical support.
- **Set Data CRC** – allows the user to rest the CRC in the level transmitter and clear the 128 Fault Code.
- **Power Cycle Device** – allows the user to power cycle the level transmitter without disconnecting power from the unit.

Data
- **No Data is Displayed**
9.2.2.8 Test device Menu Screen

Parameters
Self Test – allows user to force level transmitter to check for fault codes. Fault codes would be displayed under Status.
Data
Status – shows any existing fault codes

9.2.2.9 Status Menu Screen

Parameters
No editable parameters
Data
Fault – shows fault codes displayed by level transmitter. These codes are explained in section 8. Use must run Self Test before fault codes will appear.

9.2.2.10 Loop Test Menu Tree

Parameters
4 mA – allows the user to force loop test and current output to 4 mA
20 mA – allows the user to force loop test and current output to 20 mA
Other – allows the user to force loop test and current output to selected level
End – Stops loop test and returns level transmitter to normal output
Data
No data is displayed

9.2.2.11 Basic setup Menu Screen

Parameters
Tag – HART® descriptor that can be edited by user
PV Unit – unit of measure for the PV variable
PV LRV – lower range value of the PV that correlates to the location of the 4 mA set point of the output
PV URV – upper range value of the PV that correlates to the location of the 20 mA set point of the output
PV Damp – allows the user to select the damping of the PV variable
Data
Device Information – provide detailed information on the setup of the PV
9.2.2.12 Detailed setup Menu Screen

Parameters
Variable mapping – allows the user to select the MTS variables that are mapped to the PV, SV, and TV
Configuration – allows access to several MTS parameters
Offsets – allows access to calibrating the level transmitter
LCD settings – allows access to customizing LCD display
Sensors – allows access to data and programming of PV, SV, and TV
HART® output – allows access to setting HART® multidrop network
Data
Device Information – provide detailed information on the setup of the PV

9.2.2.13 Variable mapping Menu Screen

Parameters
PV is – allows user to select the MTS variable that is mapped to the PV in HART®
SV is – allows user to select the MTS variable that is mapped to the SV in HART®
TV is – allows user to select the MTS variable that is mapped to the TV in HART®
Data
No data is displayed

9.2.2.14 Configuration Menu Screen

Parameters
Sys Config – allows access to MTS factory parameters
Gradient – calibration factor for level transmitter that should not be changed unless replacing a sensing element.
Data
No data is displayed

9.2.2.15 Sys Config Menu Screen

Parameters
Alarm – allows user to select between a Hi (>21 mA) and Lo (<3.6 mA) alarm setting. Default is a low alarm.
Level 1 – allows user to turn product level on or off. Should always be on.
Level 2 – allows user to turn interface level on or off. This will not work if a second float is not used.
Temperature – allows user to turn temperature on or off. This will not work unless temperature is ordered on the level transmitter.
Display – allows the user to turn the display on or off. Power must be cycled for this to take affect.
Display Setting – allows the user to select if the display shows Level, mA, or %. Default setting is Level.
Lobe Count – allows the user to turn the lobe fault on or off. The lobe count should be on unless not using a MTS magnet.

Data
No data is displayed

9.2.2.16 Offsets Menu Screen

Parameters
Float 1 Offset – allows user to change the offset of the product level that is used for calibration. Please contact the factory for technical support to make this change.
Float 2 Offset – allows user to change the offset of the interface level that is used for calibration. Please contact the factory for technical support to make this change.

Data
No data is displayed

9.2.2.18 Sensors Menu Screen

Parameters
Level 1 – allows user to access parameters and data for product level.
Level 2 – allows user to access parameters and data for interface level.
Temp – allows user to access parameters and data for temperature.

Data
No data is displayed

9.2.2.17 LCD settings Menu Screen

Parameters
Screen delay – allows user to change the update rate of the display. This should not be adjusted without factory support.
Screen contrast – allows user to change the darkness of the display.

Data
No data is displayed
9.2.2.19 Level 1 Menu Screen

Parameters
Level 1 Unit – allows user to change unit of measure for product level.
Level 1 LRV – lower range value of the product level that correlates to the location of the 4 mA set point of the output.
Level 1 URV – upper range value of the product level that correlates to the location of the 20 mA set point of the output.
Level 1 Damp – damping parameter for product level

Data
Level 1 – actual product level in units of measure
Level 1 Class – variable class for product level
Level 1 Min span – the minimum distance required between the Level 1 LRV and Level 1 URV

9.2.2.20 Level 2 Menu Screen

Parameters
Level 2 Unit – allows user to change unit of measure for product level.
Level 2 LRV – lower range value of the interface level that correlates to the location of the 4 mA set point of the output.
Level 2 URV – upper range value of the interface level that correlates to the location of the 20 mA set point of the output.
Level 2 Damp – damping parameter for interface level

Data
Level 2 – actual product level in units of measure
Level 2 Class – variable class for interface level
Level 2 Min span – the minimum distance required between the Level 2 LRV and Level 2 URV

9.2.2.21 Temp Menu Screen

Parameters
Temp Unit – allows user to change unit of measure for temperature.
Temp LRV – lower range value of the temperature that correlates to the location of the 4 mA set point of the output.
Temp URV – upper range value of the temperature that correlates to the location of the 20 mA set point of the output.
Temp Damp – damping parameter for temperature

Data
Temp – actual temperature in units of measure
Temp Class – variable class for temperature
Temp Min span – the minimum distance required between the Temp LRV and Temp URV
9.2.2.22 HART® output Menu Screen

Parameter
Poll addr – allows user to change polling address of HART® device. Unless using HART® in multidrop network do not change Poll addr from default value of 0.
Num req preams – changes the HART® preamble. Do not adjust.
Data
No data displayed

9.3 Display Programming
The display menu and functionality is described in section 6. This section shows examples of the display screens and describes the variables that can be viewed and/or edited.

9.3.1 Main Menu

Data From Device – Allows the user to access standard commissioning activities such as setting 4 and 20 mA set points.
Calibrate – Allows the user to calibrate the level measurement of product level and/or interface level.
Factory – Allows the user to access Factory settings and should only be accessed under the guidance of MTS Technical Support
9.3.1.1.2 Units

**Length Units** – Allows the user to select the units of measure for the level measurement

**Temp Units** – Allows the user to select the units of measure for the temperature measurement

9.3.1.1.2.1 Length Units

Select between millimeters, centimeters, meters, kilometers, inches, feet, and yards

9.3.1.1.2.2 Temp Units

Select between Celsius and Fahrenheit

9.3.1.1.3 Set Points

**Prod LVR (4 mA)** – Allows the user to change the Loop 1 4 mA set point by changing the numerical value

**Prd URV (20 mA)** - Allows the user to change the Loop 1 20 mA set point by changing the numerical value

**Prd Current LRV** - Allows the user to change the Loop 1 4 mA set point by changing the product float position

**Prd Current URV** - Allows the user to change the Loop 1 20 mA set point by changing the product float position

**Int LRV (4 mA)** - Allows the user to change the Loop 2 4 mA set point by changing the numerical value

**Int URV (20 mA)** - Allows the user to change the Loop 2 20 mA set point by changing the numerical value

**Int Current LRV** - Allows the user to change the Loop 2 4 mA set point by changing the interface float position

**Int Current URV** - Allows the user to change the Loop 2 20 mA set point by changing the interface float position

**NOTE:** The instructions above assume that Loop 1 is product level and Loop 2 is interface level. If either of these is changed then the user is changing the process variable assigned to that Loop.

9.3.1.1.3.1 Prod LVR (4 mA)

Set the Loop 1 4 mA set point by changing the numerical value
9.3.1.3.2 Prod URV (20 mA)

Set the Loop 1 20 mA set point by changing the numerical value

Fig. 44: Display “Prod URV (20 mA)”

9.3.1.3.3 Prd Current LRV

Set the Loop 1 4 mA set point by moving the float to the desired position and confirming the change

Fig. 45: Display “Prd Current LRV”

9.3.1.3.4 Prd Current URV

Set the Loop 1 20 mA set point by moving the float to the desired position and confirming the change

Fig. 46: Display “Prd Current URV”

9.3.1.3.5 Int LRV (4 mA)

Set the Loop 2 4 mA set point by changing the numerical value

Fig. 47: Display “Int LRV (4 mA)”

9.3.1.3.6 Int URV (20 mA)

Set the Loop 2 20 mA set point by changing the numerical value

Fig. 48: Display “Int URV (20 mA)”

9.3.1.3.7 int Current LRV

Set the Loop 2 4 mA set point by moving the float to the desired position and confirming the change

Fig. 49: Display “int Current LRV”
9.3.1.1.3.8 Int Current URV

Set the Loop 2 20 mA set point by moving the float to the desired position and confirming the change.

9.3.1.1.4 Alarm Select

Select the alarm to go High or Low position and confirming the change.

9.3.1.1.5 Signal Strength

**Prod Trig Lvl** - Allows the user to view the numerical value for the strength of the return signal for product level.

**Int Trig Lvl** - Allows the user to view the numerical value for the strength of the return signal for interface level.

9.3.1.1.5.1 Prod Trig Lvl

Numerical value for the strength of the return signal, cannot be edited.

9.3.1.1.5.2 Int Trig Lvl

Numerical value for the strength of the return signal, cannot be edited.

9.3.1.2 Calibrate

**Product Level** – Allows the user to calibrate the product level

**Interface Level** – Allows the user to calibrate the interface level.
9.3.1.2.1 Product Level

**Current Level** – allows the user to calibrate based on the current tank level
**Offset** – allows the user to calibrate by changing the offset value for the level, not recommended

9.3.1.2.2 Interface Level

**Current Level** – allows the user to calibrate based on the current tank level
**Offset** – allows the user to calibrate by changing the offset value for the level, not recommended

9.3.1.2.1.1 Current Level

Enter the desired value that the product level should correspond to.

9.3.1.2.2.1 Current Level

Enter the desired value that the product level should correspond to.

9.3.1.2.1.2 Offset

**Only used based on Factory Technical Support**

9.3.1.2.2.2 Offset

**Only used based on Factory Technical Support**
9.3.1.3 Factory

Settings – Allows the user to access factory settings
Temp Setup - Allows the user to setup temperature measurement if equipped
Float Config – Allows the user to setup the number of floats used
Damping – Allows the user to set the damping of the output signal
Auto Threshold – Allows the user to enable/disable auto threshold
Reset to Factory – Allows the user to reset all factory settings

9.3.1.3.1 Settings

Gradient – Allows the user to change the calibration factor when changing sensing elements
Serial Number – Serial Number assigned by MTS at the time of manufacture. The serial number is used for tracking and replacement parts.
HW Revision – Read only information about the level transmitter’s hardware
SW Revision – Read only information about the level transmitter’s firmware
SARA Blanking – Allows the user to adjust the blanking window for the interrogation pulse.
Magnet Blanking – Allows the user to adjust the blanking window between two floats.
Gain – allows the user to adjust the strength of the interrogation pulse
Min Trig Level – Allows the user to adjust the threshold for which the return signal must meet.
Reverse Measure - Allows the end user to change the direction in which the MTS level transmitter counts.

Gradient is the speed at which the magnetostrictive signals travel along the sensing element. Typical range is from 8.9 to 9.2. Do not change unless replacing the sensing element. Changing this number will directly affect accuracy.

Serial Number assigned by MTS at the time of manufacture. The serial number is used for tracking and replacement parts

Read only information about the level transmitter’s hardware
9.3.1.3.1.7 Gain

The Gain is the strength of the interrogation pulse. MTS uses the same electronics for all lengths and adjusts the signal based on the order length. Do not adjust without talking to MTS Technical Support.

9.3.1.3.1.8 Min Trig Level

Allows the user to adjust the threshold for which the return signal must meet. The default setting is 150. Do not adjust without talking to MTS Technical Support.

9.3.1.3.1.9 Reverse Measure

Allows the end user to change the direction in which the MTS level transmitter counts. The default setting is OFF and the level transmitter will reference the tip of the pipe/hose and count up from the tip. The ON setting will reference the head of the level transmitter and count up as it moves towards the tip.

9.3.1.3.1 SW Revision

Read only information about the level transmitter’s firmware.

9.3.1.3.5 SARA Blanking

Allows the user to adjust the blanking window for the interrogation pulse. RefineME and SoClean should be at 25 and Tank SLAYER and CHAMBERED at 40. Do not adjust without talking to MTS Technical Support.

9.3.1.3.6 Magnet Blanking

Allows the user to adjust the blanking window between two floats. Default is 20. Do not adjust without talking to MTS Technical Support.
9.3.1.3.2 Temp Setup

**Temp Enable** — Allows the user to turn the temperature measurement function on or off. Does not enable the function if the unit was not ordered with temperature measurement.

**No of Temp** — Allows the user to adjust the number of temperature measurement points the level transmitter is looking for. Does not adjust the physical number of temperature sensors that were ordered. Analog only has the option for one temperature sensor.

9.3.1.3.2.1 Temp Enable

Allows the user to turn the temperature measurement function on or off. Does not enable the function if the unit was not ordered with temperature measurement.

9.3.1.3.2.2 No of Temp

Allows the user to adjust the number of temperature measurement points the level transmitter is looking for. Does not adjust the physical number of temperature sensors that were ordered. Analog only has the option for one temperature sensor.

9.3.1.3.3 Float Config

**Loop 1** — Allows the user to turn on or off the product level float. Does not change the number of floats on the level transmitter.

**Loop 2** — Allows the user to turn on or off the interface level float. Does not change the number of floats on the level transmitter.

9.3.1.3.3.1 Loop 1

Allows the user to turn on or off the product level float. Does not change the number of floats on the level transmitter.
9.3.1.3.3.2 Loop 2

Allows the user to turn on or off the interface level float. Does not change the number of floats on the level transmitter.

9.3.1.4 Damping

**Loop 1** – Allows the user to select the rate of change of the output for Loop 1. This does not change the rate at which the actual float is moving.

**Loop 2** – Allows the user to select the rate of change of the output for Loop 2. This does not change the rate at which the actual float is moving.

9.3.1.3.4.1 Loop 1

Allows the user to select the rate of change of the output for Loop 1. This does not change the rate at which the actual float is moving. Default setting is 0.4 s. Setting a very high damping rate can allow for a tank to overfill.

9.3.1.3.4.2 Loop 2

Allows the user to select the rate of change of the output for Loop 2. This does not change the rate at which the actual float is moving. Default setting is 0.4 s. Setting a very high damping rate can allow for a tank to overfill.

9.3.1.3.5 Auto Threshold

Default setting is ON and should not be turned off. This feature allows the unit to automatically adjust the threshold for optimal performance.

9.3.1.3.6 Reset to Factory

Allows the end user to reset all settings back to the original settings as they were when they left the MTS factory. This is intended to be used as a first step in troubleshooting. Do note, the Zero and Span set points will reset to factory settings.
